

Schematic of On-site System Design Using Soil Absorption

<image><figure><image><image><image>

Standard ET or ETA Bed

- Lined or unlined systems use absorption, as well as evaporation and transpiration (evapotranspiration)
- Vegetation cover must be maintained to optimise evapotranspiration
- Effluent drawn up from storage into root zone of plants by capillary action
- Shape of surface designed to maximise runoff
- Surface area calculation (water balance required)
- Often used where site limitations exist e.g. in locations with low permeability soils and useful in drier climates

cet

Design of Subsurface Systems ...

Depends on:

- <u>Hydraulic capacity of soil</u> limiting design parameter (LDP) for soils of low hydraulic conductivity
- · Purification ability of soil not easily assessed
- · Hydraulic load application rate of wastewater
- A simple set of design criteria which adequately considers all the above factors does not exist

(Adapted from Table L1 AS/NZS1547:2012)					
Soil Category	Soil Texture	Structure Range of categories not shown	Indicative K (m/d)	Primary Conserv. DLR (mm/d)	Primary Max. DLR (mm/d)
1	Gravels & sands	Massive	> 3.0	See note	See note
2	Sandy loams	Range	1.4 - 3.0	15	25
3	Loams	Range	0.5 - 3.0	10	25
4	Clay loams	Range	0.06 - 1.5	4	15
5	Light clays	Range	0.06 - 0.5	5	8
6	Heavy clays	Range	< 0.06 - 0.5	See note	See note
	For primary treated effluent conservative DLR should be used

DI R for Trenches and Beds

Soil Absorption - Simple Example

- Assume soil DLR is 15 mm/d*
- Assume hydraulic load is 150 L/p/d
- 1 Litre of water or effluent applied to 1 m² covers to a depth of 1 mm
- Maximum effluent loading rate should therefore not exceed 15 L/m² otherwise failure will occur
- Required <u>contact area</u> is therefore 10 m² (based on hydraulic load (150 L divided by DLR of 15 L/m²)

*Remember – 1 mm/day is equivalent to a loading rate of 1 L/m²/day For example, 20 mm/day is dimensionally equivalent to 20 L/m²/day

Design Method - Trenches and Beds (AS/NZS1547:2012)

- Undertake SSE procedure and determine land capability constraints and setbacks or buffers need suitable deep soil for absorption
- Assuming site and soil appropriate (not in medium or heavy clay), select primary DLR taking into account any limiting factors raised in SSE report
- · Size disposal areas according to:

$L = Q/(DLR \times W)$

where L = trench length (m), Q = design daily flow (L/d), DLR = design loading rate (mm/d) and W = width (m)

Centre for Environmental Training

Design Method - Trenches and Beds (AS/NZS1547:2012)

- Example: L = Q/(DLR × W)
- Daily design hydraulic load Q = 750 L/d
- DLR 15 L/m²/d (assessed by designer based on field measurement or field/lab textural method; conservative DLR used for primary effluent)
- Assume a trench 1 m wide then,
- L = 750/(15 × 1) = 50 lineal metres
- DLR in AS/NZS1547 (2012) is to be used to size horizontal bottom area only in trenches and beds

Centre for Environmental Training

Alternative Trench Systems and Non-conventional Beds

- Variety of alternatives to traditional trench and bed designs
- NcBs seek to enhance the performance of more traditional trenches and bed designs
- Make use of larger basal area, inter-trench space for evapotranspiration using various plants and/or provide additional treatment (i.e. filtration) so that higher design loading rates can be applied

Centre for Environmental Training

Wick Trench and Bed

- can be used in other soil types too
- Suitable for both Primary and Secondary . effluent
- · Suited to small blocks
- · Assists trench seepage with evapotranspiration from adjacent bed
- Evapotranspiration bed can be either side of trench
- For use in clay soils but Trench and bed are linked by a geotextile wrap which lies both under and over the trench and bed
 - Geotextile wick draws moisture upwards by capillary action into the root zone of the vegetation above
 - Design calculation uses loading factor to reflect improved storage/ET efficiency in the design

Centre for Environmental Training

Advanced Enviro-Septic (AES)

- Combined treatment and disposal pipe system
- Pipes installed in the land application area as either absorption trenches or evapo-transpiration beds and surrounded by a layer of coarse washed sand
- Pipes are corrugated, perforated, high-density plastic with a series of ridges and "skimmers" extending into its interior
- Skimmers capture grease and expose to aerobic degradation
- A non-woven geo-textile plastic fabric around the mat of fibres acts as filter and surface for biomat growth
- Sand allows air transfer to biomat surface and further filtration before effluent enters underlying soil

https://www.enviro-septic.com.au/

Centre for Environmental Training

Evapotranspiration Trenches

- Use balance tank after ST and consists of separate linked concrete pods
- Small footprint raised garden beds filled with imported suitable soil
- Suitable for poor soils and difficult sites
- Effluent remains subsurface and is recirculated
- · Commercial term Rhizopods

Evapo(transpiration) Beds

- Above ground land application
 evaporative system
- Bed of substrate where wastewater is evaporated
- Materials such as treated timber, corrugated iron and brick used to enclose substrate
- Suitable for poor soils and difficult sites
- Plants and landscaping can be incorporated into the design
- 4 bedroom 1,000 L/day system footprint: 10m × 4m × 0.6m high http://www.evapocycle.com/home/

Summary

- Trenches and beds utilising soil absorption (and evapotranspiration) continue to provide an effective means of land application and treatment of effluent
- Soils can provide excellent renovation capacity when loaded at an appropriate DLR, but trenches not suited to heavy soils without some site and soil modification
- Systems incorporating evapotranspiration require water balance sizing
- SSE very important in designing systems and design needs to be undertaken by trained persons
