On-site Wastewater Management Training Course

Evapotranspiration Systems and Sizing by Water Balance

Centre for Environmental Training

Terminology

Evapotranspiration Systems referred to as:

- Evapotranspiration Absorption Systems ETA Australia (unlined)
- Evapotranspiration Seepage Systems ETS New Zealand (unlined)
- · Or simply Evapotranspiration Systems ET, if lined

Centre for Environmental Training

Purpose

ETA/S Systems designed to:

- · Maximise evapotranspiration
- · Reduce absorption (drainage) in unlined systems
- · Avoid absorption in lined systems
- Provide alternative to conventional trenches/beds in areas of low permeability soils (<0.5-1.5 m/d) e.g. clay loams, light, medium and heavy clays

Centre for Environmental Training

AS/NZS 1547:2012

- Table L1 gives recommended DLRs of between 12 mm/d (CL) and 5 mm/d (LC/MC) based on soil texture
- Not necessary for annual evaporation to exceed annual precipitation
- Can use plant transpiration and void space storage to manage hydraulic load throughout seasons

Centre for Environmental Training

AS/NZS 1547:2012

- · DLRs are conservative values
- Any variation to be justified by full water balance for 12-month cycle (Appendix Q)
- No higher DLRs for Secondary treated effluent (may be better to use conventional trench or bed)
- Plant with grasses and shrubs which tolerate wet conditions and have high evapotranspiration capacity
- · Construction outlined in Appendix L

Centre for Environmental Training

Water Balance Design

- Background outlined in Appendix Q in AS/NZS1547:2012
- · Main factors:
 - Effluent largely disposed of through deep infiltration, interflow and evapotranspiration
 - Evapotranspiration is significant but may not dominate water balance
 - Some deep infiltration is required to prevent salt build up
 - Not suited to shallow water tables unless using a lined system

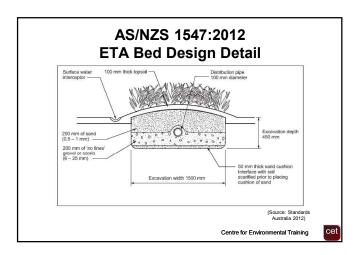

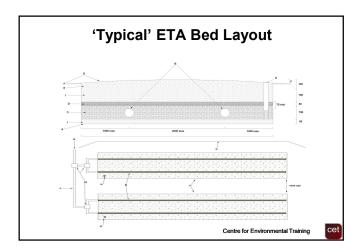

Important Components of ET Bed Design

- Crop Factors (Cf), Evaporation (E) and Evapotranspiration (ET) – explained further in water balance example later
- Capillary Water movement of water laterally and upwards under surface tension
- Field Capacity (FC) upper limit of available water storage in soil / medium
- Void Ratio (n) proportion of bed available for water/air storage

Centre for Environmental Training

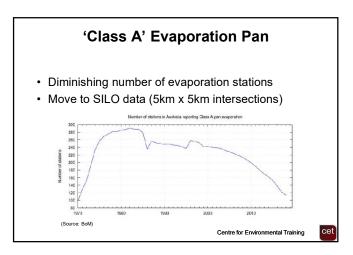

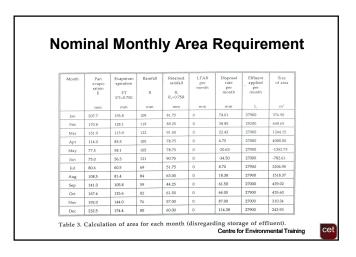

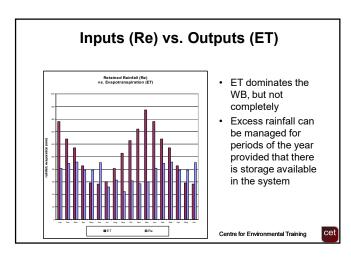

Consideration of Climatic Data

- Pan evaporation (E)
 - From nearest climatically similar meteorological station
- Rainfall (R)
 - From nearest climatically similar meteorological station
- Or use SILO data:
- · https://www.longpaddock.qld.gov.au/silo/

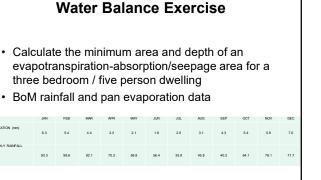

The Use of Water Balances • Will work through an example of an unlined ETA bed • Have provided templates for water balances for beds and also irrigation areas • Once you have practiced the skills required in doing water balances longhand they lend themselves to setting up spreadsheets to speed calculation

Water Balance Exercise

· Three test pits excavated on the proposed disposal area indicate that the soils are 475 mm weakly structured clay loam overlying moderately structured light clay to a depth of 2,000 mm. Use the recommended design loading rate derived from Table L1 of AS/NZS 1547:2012 (see the Field Workshop and Design Exercise section of these Course Notes)

Centre for Environmental Training

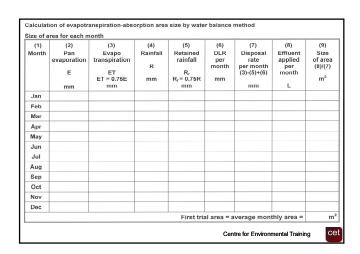

Water Balance Exercise

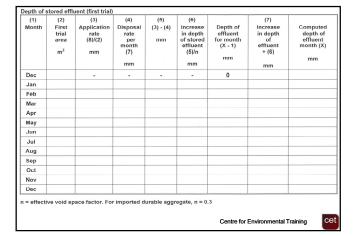

- · Calculate the evapotranspirationabsorption/seepage area using the worksheets provided on the following pages
- The evapotranspiration-absorption area is to be constructed of imported aggregate, is to have a maximum depth of 400 mm with a minimum of 50 mm freeboard (i.e. maximum depth of stored effluent is 350 mm)
- Conventional beds may have between 300 mm and 600 mm of aggregate, ETA/ETS beds 400 mm of aggregate and sand

Centre for Environmental Training

Centre for Environmental Training

Conclusions and Discussion

- Can use water balances to size/check size of all land application areas
- Previous example of unlined bed
- Slight modification for lined bed or trench (LTAR/DLR = 0)
- · Similar water balance used for sizing irrigation areas but considers soil as an infinitely thin store (i.e. no soil storage) for conservative sizing
